

# Dimensional Letter Installation Instructions for tape mount

## Tools needed for install:

Tape measure - Scissors to cut template

Removable masking tape to hold template onto wall - Small bubble level to make sure the letters are level and straight

(Masking tape without an aggressive adhesive that could damage the surface when removing)

(Round letters will need to be visually straight as a level will not help with those)

1. Position paper template exactly where you want the signage placed on the surface.

2. Start at the top line of text and cut along line at the bottom of text.

3. Remove liner from foam tape and gently apply letters to the surface. (DO NOT APPLY MUCH PRESSURE) Line the letters up with the bottoms of the cut off letter on the template. (For Descending letters you will need cut the template at the descender bottom after the other letters are attached.)

4. Follow steps 2 and 3 for the next line of text. (For Descending letters you will need cut the template at the descender bottom after the other letters are attached.)

5. Once all letters are applied to the surface you can look them over and make sure they are all level and straight. Once you are happy with them then apply firm pressure to the letters to make sure they are adhered to the surface.

## Additional items that can be used for install:

If surface is a rough surface you may need to use a silicone adhesive in very small quantities along with the foam tape to help the lettering adhere to the wall. The tape will hold the letters in place while the adhesive dries.
